

# Performance testing with JMeter

---

# Why performance testing?

## Non function requirements

- ▶ Performance, latency
- ▶ How far can you load the system ensuring error-free behavior?

## How?

- ▶ Synthetic load generation
  - ▣ simulate user actions (functional)
- ▶ Measurement & reporting instrumentations

The **Apache JMeter™** application is open source software, a 100% pure Java application designed to load test functional behavior and measure performance. It was originally designed for testing Web Applications but has since expanded to other test functions.

## What can I do with it?

Apache JMeter may be used to test performance both on static and dynamic resources (Webservices (SOAP/REST), Web dynamic languages - PHP, Java, ASP.NET, Files, etc. -, Java Objects, Data Bases and Queries, FTP Servers and more). It can be used to simulate a heavy load on a server, group of servers, network or object to test its strength or to analyze overall performance under different load types. You can use it to make a graphical analysis of performance or to test your server/script/object behavior under heavy concurrent load.

## What does it do?

Apache JMeter features include:

- Ability to load and performance test many different server/protocol types:
  - Web - HTTP, HTTPS
  - SOAP / REST
  - FTP
  - Database via JDBC
  - LDAP
  - Message-oriented middleware (MOM) via JMS
  - Mail - SMTP(S), POP3(S) and IMAP(S)
  - Native commands or shell scripts
  - TCP
- Complete portability and **100% Java purity**.
- Full **multithreading** framework allows concurrent sampling by many threads and simultaneous sampling

# Browser vs JMeter as HTTP clients

## Browser lifecycle

User performs an action

Browser sends an HTTP request

Server processes the request and responses

Browser parses the response and executes scripts

## JMeter behaviour

~~User performs an action~~

JMeter sends an HTTP request

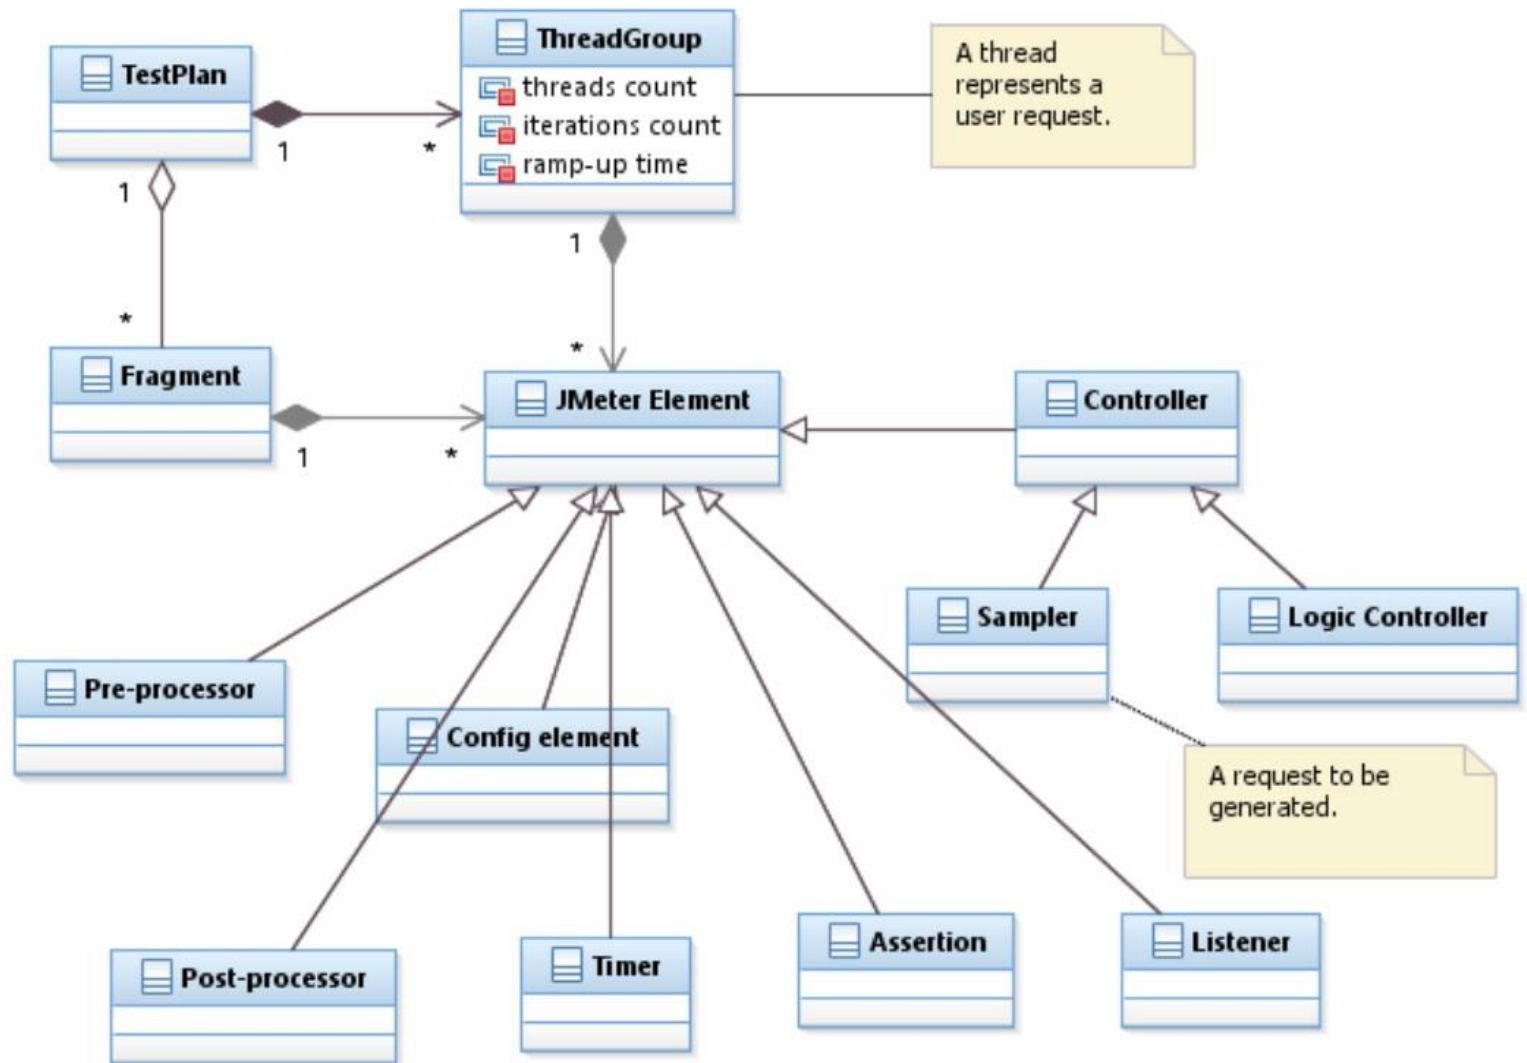

Server processes the request and responses

JMeter parses the response ~~and executes scripts~~

Repeat

# JMeter elements

# JMeter elements

Element	Semantics
Test Plan	A JMeter script.
Thread Group	Simulates a group of users (request ~ user)
Sampler	An action that causes a request.
Config	Additional configuration.
Timer	Add a predefined delay.
Assertions	Error checking to evaluate responses
Pre-processor	Modify the request before it is issued
Post-processor	Modify the response
Logic controller	Control node (alternatives, looping,...)

# Some useful Samplers

HTTP Request

FTP Request

JDBC Request

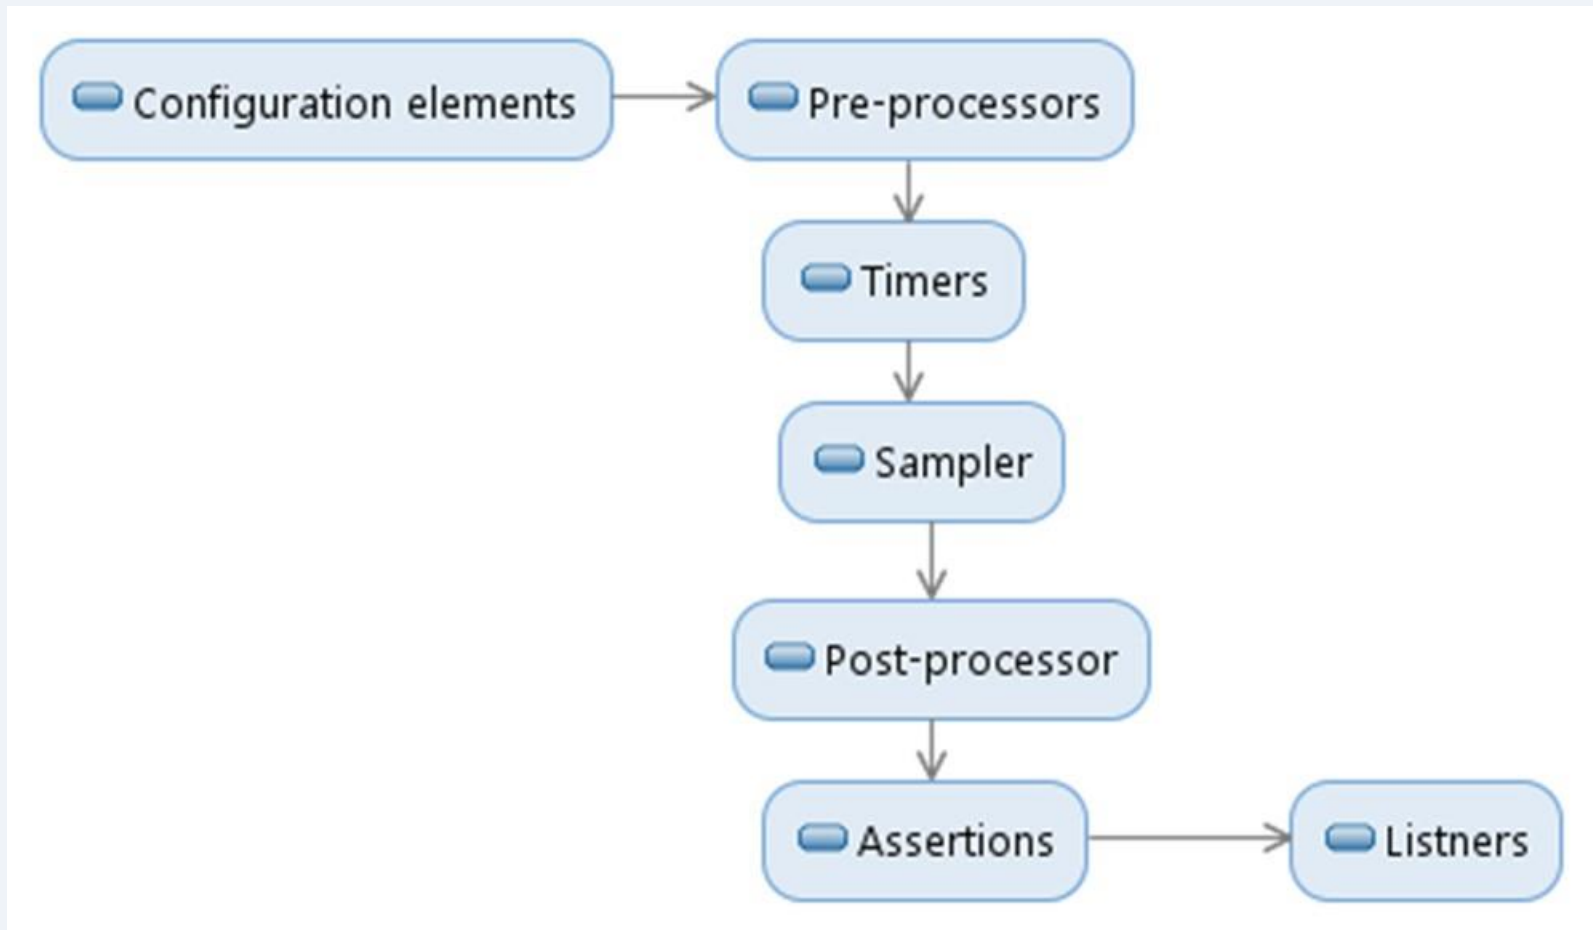

Java Request

SOAP/XML Request

RPC Requests

# Execution order of test elements

# JMeter dashboard

The screenshot shows the Apache JMeter interface with the following components and annotations:

- Test case root:** Points to the 'TQS-sample' node in the left sidebar.
- Users pool simulation:** Points to the 'Thread Group' node in the left sidebar.
- User actions/requests simulation:** Points to the 'homepage' and 'wordpress' nodes in the left sidebar.
- Results reporting (by Listeners):** Points to the 'Summary Report' node in the left sidebar.
- Interactions are mainly based on right-click options:** Points to the 'WorkBench' node in the left sidebar.

The main window displays the 'Summary Report' for the 'blaze.jmx' file. The report includes the following data:

Label	# Samples	Average	Min	Max	Std. Dev.	Error %	Throughput	KB/sec	Avg. Bytes
homepage	15	598	122	763	225,52	0,00%	13,4/min	1,38	6332,6
wordpress	3	267	259	274	6,34	100,00%	2,1/sec	8,02	3952,0
TOTAL	18	543	122	763	239,93	16,67%	16,1/min	1,56	5935,8

# Basic http request

New test plan, with descriptive name

## Simulate

- ▶ 4 users
- ▶ 1 visit
- ▶ to UA's home page (http request)

## Display the results

- ▶ in Results Tree view
- ▶ in Summary report

[http://www.tutorialspoint.com/jmeter/jmeter\\_web\\_test\\_plan.htm](http://www.tutorialspoint.com/jmeter/jmeter_web_test_plan.htm)

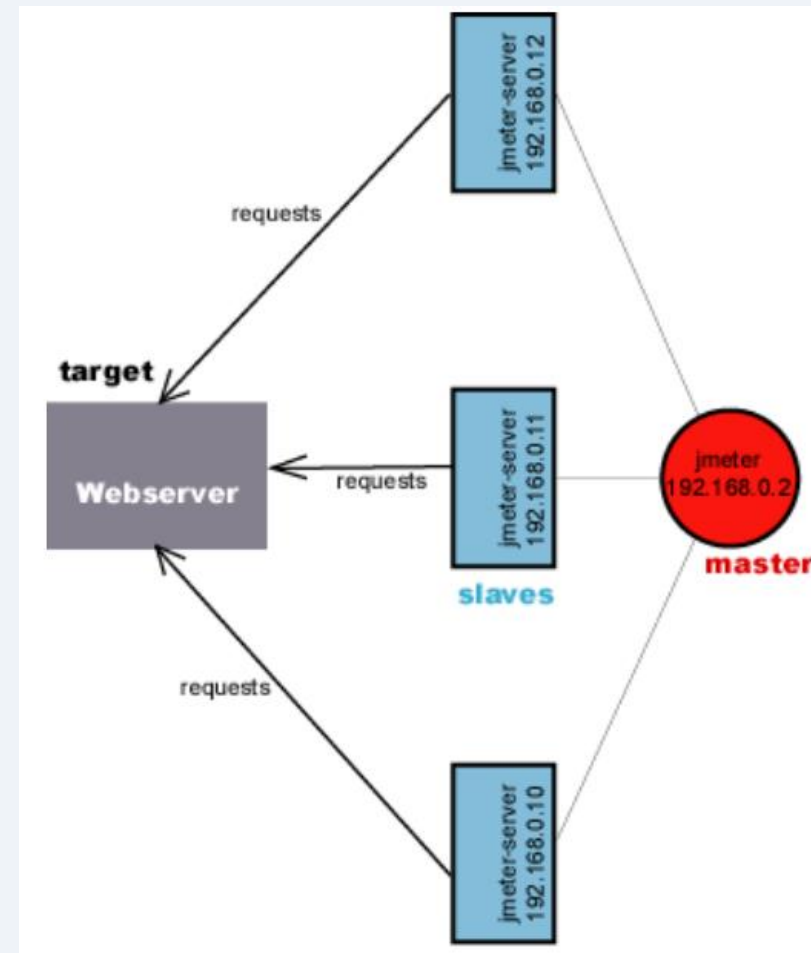

# Test a REST endpoint

- ▶ Add http request
- ▶ Provide details for GET
- ▶ Change the http-header to send json

# Distributed performance testing

## Master/slave architecture

# JMeter practices

Use multiple instances of JMeter if using many threads

JMeter can be run without GUI

- ▶ `jmeter -n -t test.jmx -l test.jtl`

Use as few Listeners as possible

- ▶ deactivate/activate

Prefer CSV over XML to save results

If the machine running the test case is resource-exhausted (e.g.: CPU 100%), the results will not be reliable.
